Liver Care

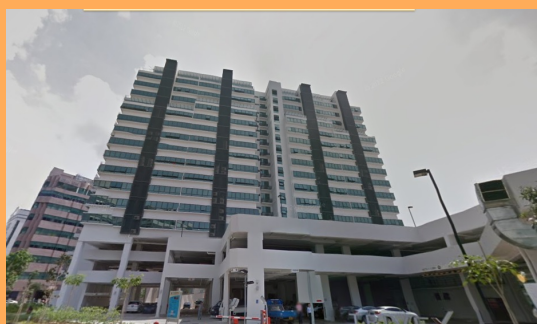

Liver is an important organ. It is located in the upper right quadrant of the abdomen, below the diaphragm. Functions of liver include detoxification of various metabolites, protein synthesis, and the production of biochemicals necessary for digestion. It plays a role in metabolism, regulation of glycogen storage, decomposition of red blood cells and hormone production.

Currently, there is no way to compensate for the absence of liver function in the long term, although liver dialysis techniques can be used in the short term. As of now, liver transplantation is the only option for complete liver failure.

What a good liver does

You will overload your liver when you eat more junk food. Ability of liver to process and create the nutrients you need will be hindered. Process and utilize fat is reduced. When your liver is functioning well, fats are eliminated through your body. If you consume plenty of fibre, this fat is absorbed by the fibre and held there until you have a bowel movement. If you do not eat enough fibre, this fat can be reabsorbed by the colon walls and routed back to the liver to be reprocessed.
